

Wapanocca Heron/Egret Rookery
May 17, 1994
Glen Miller and Chester McGee

Although numbers could not be substantiated, it appears great egret nesting dramatically increased over last year. The rookery appears to be slowly moving west. Anhinga nesting is suspected, 4 were seen getting out of tree # 55 and a total of 6 were seen flying, somewhat paired off.

Most of the aluminum tags are on the northerly side of trees containing or at one time containing nests. Numbers 58-100 start at the west end and generally head east.

Some great blue heron young almost fully feathered. Unknown how many nests were active this year.
